Project Proposal Recap

Introduction

Solid
Mechanics

Linear
Elasticity
Boundary
Value
Problems

W-PINNs

Software and
Coding
Languages

- Investigate PINNs and their ability to solve forward and inverse problems in solid and fluid mechanics
- Compare to classical numerical methods such FVM, FEM, and NLS
- **Problems in question:**
 - Conservation Laws - Burgers equation, Euler equations for compressible flow [1] – Fluid Mechanics
 - Plane stress linear elasticity boundary value problem [2] – Solid Mechanics

Why PINNs?

Introduction

Solid
Mechanics

Linear
Elasticity
Boundary
Value
Problems

W-PINNs

Software and
Coding
Languages

Advantages:

- Simplistic implementation to solve PDEs compared to FVM and FEM
- Parameter estimation requires less data and is faster than standard parameter estimation methods
- Meshless method
- Purpose is to "solve supervised learning tasks while respecting any given law of physics described by a general nonlinear partial differential equation" (Karniadakis et al.)

Drawbacks:

- Forward problem is slower than classical PDE solvers at times
- Weak theoretical grounding

PINNs Universal Approximation Theorem

Introduction

Solid
Mechanics

Linear
Elasticity
Boundary
Value
Problems

W-PINNs

Software and
Coding
Languages

Theorem (Pinkus, 1999):

Let $\mathbf{m}^i \in \mathbb{Z}_+^d$, $i = 1, \dots, s$, and set $m = \max_{i=1, \dots, s} |\mathbf{m}^i|$. Assume $\sigma \in C^m(\mathbb{R})$ and is not a polynomial. Then the space of single hidden layer neural nets:

$$\mathcal{M}(\sigma) = \text{span}\{\sigma(\mathbf{w} \cdot \mathbf{x} + b) : \mathbf{w} \in \mathbb{R}^d, b \in \mathbb{R}\}$$

is dense in $C^{m^1, \dots, m^s}(\mathbb{R}^d)$. In other words, for any $f \in C^{m^1, \dots, m^s}(\mathbb{R}^d)$, any compact $K \subset \mathbb{R}^d$, and any $\epsilon > 0$, there exists a $g \in \mathcal{M}(\sigma)$ satisfying

$$\max_{\mathbf{x} \in K} |D^k f(\mathbf{x}) - D^k g(\mathbf{x})| < \epsilon$$

for all $\mathbf{k} \in \mathbb{Z}_+^d$ for which $\mathbf{k} \leq \mathbf{m}^i$.

Project Accomplishments

Introduction

Solid
Mechanics

Linear
Elasticity
Boundary
Value
Problems

W-PINNs

Software and
Coding
Languages

- Created the first PIDL solver which solves a general hydrodynamic shock-tube problems, W-PINNs-DE
 - Bypasses theoretical and computational limitations faced by original PINNs
 - Solves shock-tube problems to higher accuracy in comparison to other PINNs and finite volume methods
- Demonstrated W-PINNs ability to solve inverse hydrodynamic shock-tube problems
- Used W-PINNs to solve plane stress linear elasticity boundary value problems (LEBVP)

- **Motivation:** Solid and Structural Mechanics
- The material matrix for an isotropic material in an elasticity boundary value problem consisting of two parameters, E - Young's Modulus, and ν - Poisson Ratio.
- Let $M_{E\nu} = \frac{E}{(1+\nu)(1-2\nu)}$. Then the material matrix is defined by:

$$C = M_{E\nu} \begin{pmatrix} 1-\nu & 0 & 0 & 0 & \nu & 0 & 0 & 0 & \nu \\ 0 & 1-2\nu & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 1-2\nu & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 1-2\nu & 0 & 0 & 0 & 0 & 0 \\ \nu & 0 & 0 & 0 & 1-\nu & 0 & 0 & 0 & \nu \\ 0 & 0 & 0 & 0 & 0 & 1-2\nu & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 1-2\nu & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1-2\nu & 0 \\ \nu & 0 & 0 & 0 & \nu & 0 & 0 & 0 & 1-\nu \end{pmatrix}$$

- Solve for the amount of deformation a material undergoes under prescribed body force, f , and surface force, g

LEBVP

Introduction

Solid
Mechanics

Linear
Elasticity
Boundary
Value
Problems

W-PINNs

Software and
Coding
Languages

- The deformation tensor is defined as

$$\boldsymbol{u} = (u_1, u_2, u_3)^T$$

- u_i corresponds to the deformation in the x, y , and z direction, and $u_i : \mathbb{R}^3 \rightarrow \mathbb{R}$.
- We solve for the deformation of a material undergoing loading by solving the equilibrium equation:

$$\begin{cases} -\nabla \cdot \boldsymbol{\sigma} = \boldsymbol{f}, & x \in \Omega \subset \mathbb{R}^3 \\ \boldsymbol{u} = 0, & x \in \Gamma_D \\ \boldsymbol{\sigma} \cdot \boldsymbol{\nu} = \boldsymbol{g}, & x \in \Gamma_N \end{cases} \quad (1)$$

where,

$$\boldsymbol{\sigma} = C\boldsymbol{\epsilon}, \quad \epsilon_{ij} = \frac{1}{2} \left[\frac{\partial u_i}{\partial x_j} + \frac{\partial u_j}{\partial x_i} \right] + \frac{1}{2} \sum_{k=1}^3 \frac{\partial u_i}{\partial x_k} \frac{\partial u_j}{\partial x_k}, \quad i, j = 1, 2, 3$$

LEBVP

Since we are considering a LEBVP, the parabolic terms vanish, hence

$$\begin{aligned}\epsilon &= \frac{1}{2} [\nabla \mathbf{u} + \nabla \mathbf{u}^T] \\ &= A \nabla \mathbf{u}\end{aligned}$$

$$= \begin{pmatrix} 1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & \frac{1}{2} & 0 & \frac{1}{2} & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & \frac{1}{2} & 0 & 0 & 0 & \frac{1}{2} & 0 & 0 \\ 0 & \frac{1}{2} & 0 & \frac{1}{2} & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 1 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & \frac{1}{2} & 0 & \frac{1}{2} \\ 0 & 0 & \frac{1}{2} & 0 & 0 & 0 & 0 & \frac{1}{2} & 0 \\ 0 & 0 & 0 & 0 & 0 & \frac{1}{2} & 0 & 0 & \frac{1}{2} \\ 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 \end{pmatrix} \begin{pmatrix} \frac{\partial u_1}{\partial x_1} \\ \frac{\partial u_1}{\partial x_2} \\ \frac{\partial u_1}{\partial x_3} \\ \frac{\partial u_2}{\partial x_1} \\ \frac{\partial u_2}{\partial x_2} \\ \frac{\partial u_2}{\partial x_3} \\ \frac{\partial u_3}{\partial x_1} \\ \frac{\partial u_3}{\partial x_2} \\ \frac{\partial u_3}{\partial x_3} \end{pmatrix}$$

Plane Stress

A material undergoes plane stress provided the stress vector is zero in a specific plane. Here we chose to have zero stresses in the z – *direction*, hence,

$$\sigma_{3j} = \sigma_{i3} = 0, \quad \text{for } i, j = 1, 2, 3$$

Then the stress tensor in the xy – *direction* is defined by:

$$\boldsymbol{\sigma} = C_{E\nu} \boldsymbol{\epsilon}$$

$$= \frac{E}{(1 - \nu^2)} \begin{pmatrix} 1 & \nu & 0 \\ \nu & 1 & 0 \\ 0 & 0 & (1 - \nu)/2 \end{pmatrix} \begin{pmatrix} \epsilon_{11} \\ \epsilon_{22} \\ \gamma_{12} \end{pmatrix}$$

where $\gamma_{12} = \left(\frac{\partial u_1}{\partial x_2} + \frac{\partial u_2}{\partial x_1} \right)$

LEBVP

$$G \left[\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} \right] + G \left(\frac{1+\nu}{1-\nu} \right) \left[\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 v}{\partial y \partial x} \right] = \sin(2\pi x) \sin(2\pi y)$$

$$G \left[\frac{\partial^2 v}{\partial x^2} + \frac{\partial^2 v}{\partial y^2} \right] + G \left(\frac{1+\nu}{1-\nu} \right) \left[\frac{\partial^2 v}{\partial y^2} + \frac{\partial^2 u}{\partial x \partial y} \right] = \sin(\pi x) + \sin(2\pi y)$$

where $G = \frac{E}{2(1+\nu)}$, $E = 1$ GPa is the Young's modulus, and $\nu = 0.3$ is the Poisson ratio of the material. The problem has fixed boundary conditions.

Algorithm 1: W-PINNs ALGORITHM

- 1 Generate weights $\theta \in \mathbb{R}^k$ and a deep neural network (DNN), $\tilde{\mathbf{U}}(x, y, \theta)$, where (x, y) are inputs to the network, and $\tilde{\mathbf{U}} = [\tilde{u}, \tilde{v}]$ are the outputs. The number of layers, neurons per layer, and activation functions for each layer are prescribed by the user.
- 2 Sample points (x_n, y_n) from Ω and w_n from $\partial\Omega$. Let N_f, N_{BC} correspond to the number of points sampled from the interior and boundary, respectively.
- 3 Generate $G(\theta)$:

$$G(\theta) = \frac{1}{N_f} \left\| \nabla \cdot \tilde{\boldsymbol{\sigma}}(x, y, \theta) + \mathbf{f} \right\|_{\Omega}^2 + \frac{\omega_{BC}}{N_{BC}} \left\| \tilde{\mathbf{U}}(x, y, \theta) - \mathbf{U}(x, y) \right\|_{\partial\Omega}^2$$

where $\omega_{BC} = 10,000$

- 4 Update θ by performing stochastic gradient descent:

$$\theta = \theta - \eta \nabla_{\theta} G(\theta)$$

where η is the learning rate.

Each neural network will have:

- 7 layers
- 30 neurons per layer
- $\tanh(\cdot)$ activation function for nonlinear layers
- learning rate of 0.0005
- No random sampling of computational domain
- 199,350 epochs

Conclusion

Introduction

Solid
Mechanics

Linear
Elasticity
Boundary
Value
Problems

W-PINNs

Software and
Coding
Languages

- W-PINNs accurately compute solutions on moderately refined mesh $N < 4,000$
- Over refinement is computationally costly and accumulates higher error
- Local refinement increases error in refinement areas
- 2,000 - 4,000 training points is recommended
